

Coated abrasives for glass

especially for edging, finishing, and polishing.

Modern Technology In Manufacturing

Today's technology provides strong polyester backings that enable the make and finish coats of abrasive to be applied with accuracy. This support for the silicon carbide grain along with resin bonding systems allows for uniform coating, providing consistent cutting power when grinding and polishing.

- ◆ Abrasive Source provides silicon carbide closed coat belts with a heavy duty polyester backing that can be used either wet or dry.
- ◆ Used primarily for glass edging and finishing in fabrication departments around the world. The closed coat silicon carbide grain minimizes chipping, burning and breaking while grinding.
- ◆ Our silicon carbide belts may be used with water to reduce airborne dust and cut cooler to improve finish.
- ◆ Bi-directional joints provide bump free splices, producing smooth finishes.
